

Homework #4

- * Rewrite the assignment from the last homework to use biopython to represent the sequences and perform the translation for you.
- * Write a program using biopython to perform a pubmed query to retrieve reference citations for all of the papers published by your mentor (you can use someone else with at least 5 publications if you prefer). Print the number of publications per year for any year with at least 1 publication. Use the <PubDate> <Year> field to identify the year for each publication. Turn in the program and the output for the person you ran it on.
- * NOTE: If you are having difficulties in getting BioPython installed, please see the Biopython website which has an installation and troubleshooting page.
- * If you are having problems figuring the second problem out, I will post some 'extra practice' problems with solutions which should help you work it through.
