HOMework REVIEW

```
loan=int(raw_input("Enter loan amount: "))
rate=(float(raw_input("Enter annual interest rate: ")) / 100)*(1.0/12.0)
payment=int(raw_input("Enter payment amount: "))

counter=1
results=file("results.txt","w")
while loan > 0:
    interest=loan*rate
    if (loan < payment):
        results.write("%3d: Interest:%8.2f Balance:%10.2f\n"%(counter, interest, 0.0))
        break
    loan=interest+loan-payment
    results.write("%3d: Interest:%8.2f Balance:%10.2f\n"%(counter, interest, loan))
    counter=counter+1

results.close()
```

'Scrabble' Problem

- What words could you make given these letters: PGAORRM?

'Scrabble' Problem

- What words could you make given tiles containing PGAORRM
- 68 of them
- program armor gomp a gramp groma maror morra pargo gamp
gapo gora gorm gorp gram marg mora ogam orra parr pram prao
proa prog prom ramp roam roar roma romp ago amp apo arm
gam gap gar goa gor mag map mar moa mog mop mor oar ora
pam par poa pom pro rag ram rap rom ag am ar go ma mo om op
or pa po a

'Scrabble' Problem

- You have 7 random letters. What real words can you make from them ?
- How many 'words' could we make ?
- $7*6*5*4*3*2*1 + 7*6*5*4*3*2 + \dots = 7! + 7!/1! + 7!/2! + 7!/3! + \dots = 13699$

'Scrabble' Problem

- You have 7 random letters. What real words can you make from them ?
- How many letter combinations could we make ?
- $7*6*5*4*3*2*1 + 7*6*5*4*3*2 + \dots = 7! + 7!/1! + 7!/2! + 7!/3! + \dots = 13699$
- Different approaches:
 - Make all possible words, check to see if each is in the dictionary
 - Linear
 - Recursive
 - Check each word in the dictionary to see if it can be made from the letters in the list

Design #1

- ask for letters
- Read list of words
- Nested loop to make each possible word from letters
 - check to see if word is real
 - if so, add it to the list
- sort the list and print results

Design #2

- ask for letters
- Read list of words
- Recursion to make each possible word from letters
 - check to see if word is real
 - if so, add it to the list
- sort the list and print results

Recursion

- A function that calls itself

```
def factorial(x):  
    if x==1 : return 1  
    return x*factorial(x-1)
```

Design #3

- ask for letters
- Read list of words
- Loop over list of words
 - make a list of available letters
 - Loop over the letters in word
 - see if each letter is in the list, if so, remove
 - if we found all of the letters print the word

Results

- Nested loop : 93.8 sec
- Nested loop (set): 0.44 sec
- Recursive : 0.38 sec
- Check all words: 0.92 sec

Numbers & Computers

Why Binary ?

$$8+7=15$$

Why Binary ?

$$18+27=45$$

Decimal Numbers

$$\begin{array}{ccccccc}
 & & & & \frac{1}{10} & \frac{1}{100} & \frac{1}{1000} \\
 1 & & & & & & \\
 0 & 1 & & & & & \\
 0 & 0 & 1 & & & & \\
 0 & 0 & 0 & 1 & & & \\
 X & X & X & X & . & X & X & X
 \end{array}$$

Diagram illustrating the decimal expansion of a number. The digits are shown in a grid, with the decimal point placed between the fourth and fifth digits. The digits are: 1, 0, 0, 0, 1, 0, 0, 0. The digits 1, 0, 0, 0 are above the decimal point, and 1, 0, 0 are below it. The digits 1, 0, 0 are above the decimal point, and 1, 0, 0 are below it. The digits 1, 0, 0 are above the decimal point, and 1, 0, 0 are below it.

1 bit binary adder

$$1+1=10$$

2 bit binary adder

1 bit binary adder

26 transistors

US Patent
4,831,578

8 bit binary adder

6800 CPU

- Introduced 1974
- 4000 transistors
- 1.0-2.5 MHz
- 3, 8 bit registers
- 3, 16 bit registers

www.cpu-world.com

Motorola 6800 CPU

- 72 instructions (197 opcodes)
- 8 bit data bus (0-255)
- 16 bit address bus (64k max RAM)
- 6 registers:
 - 8 bit ACCA
 - 8 bit ACCB
 - 16 bit IX
 - 16 bit PC
 - 16 bit SP
 - 6 bit CC

Athlon-64

- ~106 million transistors (~10 m³ if individually packaged)
- Socket-939 (939 pins)
- 40 bit addressing (1 TB)
- 64 bit data bus
- ~2 GHz
- registers:
 - 16, 64 bit integer
 - 16, 128 bit 'media'
 - 8, 64 bit float

Opteron Execution Units

Microprocessors

- 6800 ~4000 transistors, 8 bit (1974)
- 68000 ~70,000 transistors, 16/32 bit (1979)
- 68040 ~1,200,000 transistors 32 bit+FPU (1990)
- Core2 duo ~291,000,000 transistors 64 bit (2006)

File Manipulation

- `os.listdir` - Lists files in a particular folder
- `os.stat` - info about a file
- `os.rename` - rename (mv) a file
- `os.mkdir` - create a folder
- `os.remove` - delete a file
- `os.rmdir` - remove a directory
- `os.system` - execute a command (mostly mac/linux)

Homework #4

- We are going to write our first useful program (scientifically speaking). We will be computing a histogram of a list of numbers.

The input to the program will be the name of a file containing a list of numbers. Each line will contain a single number. Read this file in (you can use argv or prompt the user for a filename). Now produce a histogram of the numbers, that is, you have a set of (max-min)/bin_size 'bins', and you need to count how many of the numbers fall into each bin, then present the results. **Do not ask the user for the histogram parameters, but come up with intelligent values based on the data.** Max/min are not necessarily the max and min of the data, depending on how you decide to handle unusual cases. You could consider using 'outlier' bins. The results are just the center of each bin and how many numbers are in it.

The class website will have 3 example files to download and test your program on. Do not change the program between the 3 runs. Your program should generate reasonable results for all 3. Please email your program and the results from running it on each of the 3 data sets.

If you aren't feeling challenged, you could try to come up with a more 'artistic' way to present the results using text output.

- Install the Python Imaging Library (PIL) on your computer:

<http://www.pythonware.com/products/pil>

or 'easy_install pil'

Test by doing an 'import PIL' in python
